Preface

Facilities Management (FM) has often been misunderstood as a technical support function operating behind the scenes of infrastructure delivery. Yet, in an era defined by rapid urbanisation, climate volatility, fiscal constraint, and heightened social accountability, its strategic importance has become unmistakable. This book makes the case for repositioning FM not as a maintenance service, but as a governance capability, in which operational discipline, data integrity, and ethical supervision are foundational to infrastructure resilience and financial credibility.

I did not set out to write a book about standards. I set out to answer a question that has followed me for more than two decades: why do buildings that should work, fail to work?

I have watched newly commissioned hospitals deteriorate within a few years of opening. I have walked housing estates where lifts were broken for months, not because no one cared, but because no one had been given the authority, budget, or information to act. I have sat in rooms with infrastructure financiers willing to fund construction, but without a reliable instrument to assess whether what they built would still be functioning in ten years' time. I have also stood at Africa FM conference tables with practitioners from Nairobi, Lagos, Cairo, and Gaborone who had developed extraordinary operational ingenuity under constraint, only to see that knowledge fail to travel because it had never been documented in a form the wider world could use.

This book is my attempt to close that gap.

My career began in the United Kingdom, where I worked across public and private sector estates before returning to Botswana. That movement from a regulatory-dense, resource-rich FM environment to one defined by rapid urbanisation, fiscal constraint, and infrastructure volatility taught me something that no standard or textbook fully prepares you for: operational discipline matters more than operational budget. Sites with clear authority, honest evidence, and consistent supervision outperform sites with better systems and weaker governance.

What distinguishes this work is its grounding in lived practice. Africa's urban environments, characterised by growth pressure and infrastructure fragility, serve not as a deficit narrative but as

a proving ground. What Africa taught me, and what this book demonstrates, is that scarcity clarifies. When utilities are unreliable, every asset decision must be defensible. When maintenance budgets are tight, criticality ranking is not theoretical; it is survival. When users are vulnerable, FM stops being a cost centre and becomes part of the social contract.

These conditions are not unique to Africa. They are conditions that more cities globally will face as climate pressure, ageing infrastructure and fiscal constraint converge. Africa has simply been living them longer. The lessons developed here – criticality ranking, minimal digital stacks, stabilisation sequencing, and finance-ready evidence capture – are transferable to mature markets confronting similar systemic pressures.

This book does not recite standards. It translates ISO frameworks into operational logic applicable across housing estates, university campuses and multi-tenant portfolios. The standards–data–finance–outcomes (SDFO) method is the thread that runs through every chapter. It is the logic distilled from watching what works in the field: organisations that govern clearly, measure selectively, fund what is verified, and report honestly earn the trust of their boards, regulators, users, and lenders. Those that do not, regardless of ambition or investment, eventually fail the people who depend on them.

Acknowledgments

This book has been shaped by a community of practitioners, researchers, and professional leaders whose insight and engagement strengthened its development.

Several chapters draw upon structured exchanges at AfricaFM conferences and associated professional forums. The author expresses particular appreciation to Pieter le Roux, Duncan Waddell, Donna Ebeid, Farah Shoukry, Paul Erubami, John Samuel, Michael May, Karim Hassan, Gyan Awuku-Sao, and Arivagara Pavithran, for their intellectual generosity and practitioner evidence, which informed and challenged the arguments developed in this manuscript.

Gratitude is extended to colleagues within FMCE and AfricaFM, whose continued commitment to advancing Facilities Management across the continent reinforces the professionalisation agenda that underpins this work.

The author also acknowledges the contribution of international standards communities and governance networks, whose work in ISO-aligned management systems provides the structural foundations referenced throughout the book.

Appreciation is extended to family and professional peers, for their encouragement and sustained support during the writing process.

In line with transparent authorship practice, the author confirms that parts of the manuscript were copyedited using generative AI tools and technology to improve its structure and the clarity of the language and grammar. All interpretations, analysis and conclusions presented remain the sole responsibility and creation of the author.

About the author

Maria Morapedi is a Facilities Management (FM) strategist, governance advisor, and sector leader with over two decades of professional experience across Africa, the UK, and Australia. Her career began in the UK, where she worked with a range of public and private sector institutions in property and facilities management before returning to Botswana to apply global standards within emerging urban contexts.

She is the founder of FMCE (Facilities Management Conference and Exhibition), a platform that has facilitated cross-border knowledge exchange and contributed to the establishment and strengthening of AfricaFM. She currently serves as Vice Chair of AfricaFM, supporting continental governance development, standards adoption, and institutional collaboration across African jurisdictions.

Maria is Chair of the Facilities Management Standards Committee in Botswana, advancing the localisation and integration of ISO-aligned management systems. She has served as EuroFM Ambassador for Botswana since 2019, building structured bridges between African practitioners and international research and professional networks. She was also instrumental in the formalisation of the Botswana Facilities Management Association, strengthening national institutional representation for the profession.

As Chief Executive Officer of GPFI Botswana, she leads integrated FM operations aligned to governance, asset performance optimisation and finance-ready evidence frameworks. Her work focuses on translating international standards into disciplined operational practice under real-world constraints.

Her professional interests include governance architecture, asset management integration, green finance traceability, and capability development pathways for the next generation of FM leaders. Through advisory engagements, conferences, and professional networks, she continues to position FM as a strategic enabler of infrastructure resilience, sustainable capital allocation and inclusive urban growth globally.

Facilities Management in Africa: Bridging Global Standards and Local Realities reflects her conviction that Africa's FM experience offers transferable lessons for cities worldwide.

Abbreviations and acronyms

This section lists the key abbreviations and acronyms used throughout the book. They represent professional bodies, international standards, frameworks, and technical terms referenced within the text. The list is intended to help readers interpret commonly used terms in Facilities Management and related built environment disciplines.

AfDB	African Development Bank
AIR	asset information requirements
APAC	Asia-Pacific
BCA	Building and Construction Authority (Singapore)
BIM	building information modelling
BREEAM	Building Research Establishment Environmental Assessment Method
CAFM	computer-aided facilities management
Capex	capital expenditure
CBM	condition-based maintenance
CCTV	closed-circuit television
CDE	common data environment
CO_2e	carbon dioxide equivalent
DFI	development finance institution
EDGE	Excellence in Design for Greater Efficiencies (IFC)
EPC	energy performance certificate (Europe/UK) / energy performance contracting (context-specific, defined in text)
ESG	environmental, social and governance
ESCO	energy service company
FM	Facilities Management/Facility Management
GSL	Government Soft Landings (UK)
HVAC	heating, ventilation and air conditioning
IAQ	indoor air quality
ICT	information and communication technology
IEQ	indoor environmental quality
IFC	International Finance Corporation
IPMVP	International Performance Measurement and Verification Protocol
ISO	International Organization for Standardization ISO 14001: Environmental management systems ISO 19650: Information management using building information modelling ISO 41001: Facility management – Management systems

	ISO 41012: Facility management – Strategic sourcing and agreements
	ISO 50001: Energy management systems
	ISO 50015: Energy management systems – Measurement and verification
	ISO 55000: Asset management – Overview, principles and terminology
IWFM	Institute of Workplace and Facilities Management
IWMS	integrated workplace management system
KPI	key performance indicator
LATAM	Latin America
LEED	Leadership in Energy and Environmental Design
MENA	Middle East and North Africa
MTTR	mean time to restore/repair
M&V	measurement and verification
NQF	National Qualifications Framework
O&M	operations and maintenance
Opex	operating expenditure
PDCA	plan–do–check–act
PPP	public–private partnership
QCTO	Quality Council for Trades and Occupations (South Africa)
QEP	Quarterly Evidence Pack
RCM	reliability-centred maintenance
RICS	Royal Institution of Chartered Surveyors
SAFMA	South African Facilities Management Association
SAMP	strategic asset management plan
SDFO	standards–data–finance–outcomes
SDG	Sustainable Development Goal
SLA	service level agreements
SLL	sustainability-linked loan
TC	technical committee (e.g. ISO/TC 267)
UCT	University of Cape Town
UAE	United Arab Emirates
UK	United Kingdom
UN	United Nations
WHO	World Health Organization

Introduction: Why people-centred facilities management is Africa's most transferable urban capability

The case for this book

Facilities Management (FM) is rarely positioned at the centre of urban strategy. It typically appears after design decisions have been made and after capital has been deployed. Yet whether infrastructure delivers value depends less on architectural ambition and more on operational discipline. Across African cities, rapid urbanisation, constrained public finance, and climate exposure have made this reality visible. Infrastructure performance is determined daily by supervision quality, maintenance prioritisation, and evidence discipline. Africa's urban systems face growth rates and service pressures that increasingly resemble those emerging in other global regions. The continent therefore operates as a testing ground where weaknesses in governance or operational control are exposed quickly. Where FM succeeds under constraint, lessons are portable. The argument advanced in this book is that disciplined, people-centred FM converts operational stability into institutional credibility.

Africa as a global microcosm: why FM lessons from African cities travel

Africa's urban environments concentrate many of the pressures now reshaping cities globally: rapid population growth, infrastructure fragility, affordability constraints, climate volatility, energy insecurity, and rising expectations for safer, healthier, and more inclusive places. These pressures are often described as African challenges, but they are increasingly global operating conditions. What is acute in Lagos, Nairobi, Gaborone, Kigali, or Accra is also becoming visible across the Asia-Pacific region, Latin America, the Middle East and North Africa, and Europe, as ageing infrastructure, fiscal pressure, extreme weather, and social inequality converge.

This is why Africa should not be treated as a peripheral case in FM. It should be understood as a global microcosm: a compressed operating environment where the future pressures of urban management are already visible. In such conditions, FM cannot depend on abundant budgets, perfect data, mature supply chains, or ideal operating conditions. It must work through disciplined prioritisation, clear accountability, reliable evidence, and practical sequencing.

The lessons are operational. Critical assets must be ranked because not everything can be fixed at once. Supervisors must have clear authority because slow decisions increase risk.

Data must be minimal but reliable, because excessive reporting overwhelms teams without improving control. Contracts must reward outcomes rather than activity, because input-based service models collapse under pressure. Evidence must be credible enough for boards, regulators, and funders to trust because sustainable investment cannot be built on intention alone.

Viewed this way, Africa is not simply a context for applying global standards. It is a proving ground for making those standards operational. ISO-aligned FM only becomes meaningful when it is translated into daily routines: asset criticality, operational control loops, supervisor competence, contractor discipline, measurement and verification, and Quarterly Evidence Packs that show what is stable, what is failing, and what requires investment.

This book therefore treats African FM practice as globally relevant because it reveals how maturity is actually built. Stability must come before visibility. Control must come before reporting. Evidence must come before finance. Reliability must come before benchmarking. Scaling must come after rhythm. These principles underpin the 180-day roadmap for implementation, the sector playbooks and the appendices that support this book's practical method.

The central argument follows from that insight: FM becomes globally transferable when it turns local constraint into disciplined, evidence-led practice. Africa's value is not that it is exceptional. Its value is that it reveals, earlier and more sharply, the operating realities that many cities and institutions will increasingly have to manage.

Structure of the book

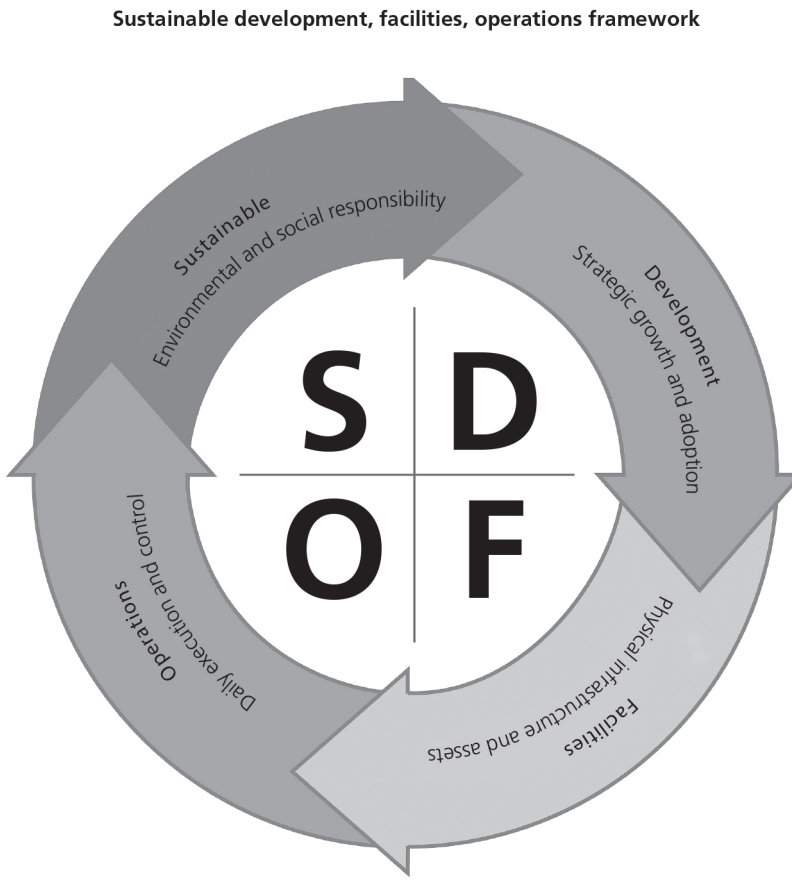
The book progresses through seven structured chapters. Chapter 1 establishes the SDFO (standards, data, finance, outcomes) method, positioning FM as an operating system rather than a support service. Chapter 2 translates international standards into governance architecture and minimal digital foundations. Chapter 3 examines Tactical FM, including baselines, contracts, budgets, and measurement and verification, framing FM as the assurance layer that makes green and sustainability-linked finance bankable. Chapter 4 focuses on the Operational Control Loop and continuity discipline. Chapter 5 reframes capability, ethics, and supervision as assurance functions. Chapter 6 provides sector playbooks for housing, university estates, and multi-tenant portfolios. Chapter 7 sequences maturity through a disciplined 180-day Implementation Roadmap. Each chapter builds on the previous one. No new tools are introduced without behavioural grounding. The emphasis throughout is application rather than abstraction.

Standards as structural logic: how FM turns governance into evidence

Standards are used in this book not as a compliance checklist, but as structural logic. Their purpose is to give FM a coherent operating system: one that clarifies accountability, defines information flows, connects contracts to outcomes, and converts operational performance into evidence that boards, regulators, funders, and users can trust.

The Standards Spine is built around six core functions. ISO 41001 provides the FM system, setting the governance frame for policy, leadership, objectives, roles, performance review,

Figure 0.1 SDFO Method



and continual improvement. ISO 41012 supports sourcing and service agreements, ensuring that contracts reward outcomes rather than activity. ISO 55000 connects FM decisions to asset value, lifecycle planning, and long-term investment discipline. ISO 19650 protects information integrity by structuring asset information requirements, handover data, and the common data environment. ISO 14001 embeds environmental management, while ISO 50001 strengthens energy performance, baselines, and improvement discipline.

Used together, these standards create a line of sight from policy intent to operational proof. They help organisations answer practical questions: Who is accountable? What assets matter most? What data is reliable? Which risks require escalation? Which interventions deserve funding? How can improvement be verified? This is the logic that underpins the Quarterly Evidence Pack, the Operational Control Loop, the 180-day Implementation Roadmap and the sector playbooks.

This approach is particularly important in African cities, where infrastructure pressure, constrained budgets, and uneven data quality make over-complex systems difficult to sustain. Standards provide a common language without requiring identical local conditions. The governance logic stays constant; the thresholds, tariffs, regulatory duties, climate risks, and funding mechanisms localise.

For this reason, the book treats standards as enabling infrastructure. They make FM governable, comparable, auditable, and finance-ready. Their value is not in being cited, but in being operationalised through daily routines, evidence discipline, contract design, and investment decisions.

People at the centre

The term 'people-centred' is deliberate. Buildings do not fail – systems and behaviours fail. In housing, FM protects dignity. In healthcare, it protects safety. In education, it protects continuity. In commercial assets, it protects uptime and revenue stability. Operational credibility depends on three reinforcing conditions: capable supervision, ethical clarity, and data literacy. Where these are present, infrastructure performs predictably. Where they are absent, performance deteriorates regardless of investment level.

From cost centre to capital steward

FM is frequently categorised as a cost to be reduced. This framing overlooks its role in protecting asset value and enabling capital access. Deferred maintenance erodes lifecycle performance. Weak data limits options for refinancing. Inconsistent control increases operating expenditure. When baselines are defined, interventions ranked, and outcomes verified, operational discipline becomes auditable. Finance follows evidence. Evidence follows control. This shift repositions FM from reactive expenditure management to structured capital stewardship to structured capital stewardship, preparing the ground for the sector playbooks and 180-day Implementation Roadmap in Chapters 6 and 7.

Intended audience and contribution

This book is written primarily for FM practitioners, FM directors, heads of estates, asset managers, property owners, public-sector infrastructure leaders, and built-environment professionals who are responsible for turning buildings and infrastructure into reliable, safe, inclusive, and financially credible operating environments.

It is also intended for policymakers, regulators, procurement teams, developers, housing authorities, university estates teams, and municipal leaders who need practical methods for aligning infrastructure delivery with lifecycle performance. For these readers, the book shows how FM can move beyond maintenance response and become a governance capability that protects public assets, improves service reliability, and strengthens accountability.

A further audience is made up of lenders, development finance institutions, ESG teams, sustainability officers, green-finance specialists, and energy performance contracting teams. The book explains how standards-aligned FM can produce the evidence required for green loans, sustainability-linked finance, energy performance contracts, measurement and verification, and environmental, social, and governance (ESG) reporting. Its contribution is to show that finance-ready performance depends not only on capital investment, but also on operational control, reliable data, and disciplined assurance.

The book is also relevant to students, and to academic institutions, educators, and professional bodies teaching or developing programmes in FM, asset management, sustainable built environments, infrastructure governance and ESG-aligned performance. It provides a practitioner-centred framework that can be used in postgraduate teaching, executive education, professional development, and sector capacity-building.

The contribution of the book is threefold. First, it translates international standards – including ISO 41001, ISO 41012, ISO 55000, ISO 19650, ISO 14001, and ISO 50001 – into an operating method that can be applied under real-world constraints. Second, it connects FM practice to finance, showing how evidence from operations can support investment, assurance, and sustainability-linked outcomes. Third, it positions African cities not as peripheral case contexts, but as a global microcosm where the pressures now facing cities worldwide are visible earlier and more sharply.

The book therefore serves both as a practitioner playbook and a strategic bridge between standards, operations, finance, and social value. Its purpose is not to turn FM into a compliance exercise, but to show how people-centred FM can deliver measurable outcomes for users, asset owners, funders, and public institutions.

Chapter 1

People-centred facilities management for African cities shows why Africa is a global microcosm

1.1. Purpose and scope of this chapter

This chapter sets the baseline for the book. It explains why Facilities Management (FM) functions as the operating system of the built environment; why Africa's realities of rapid urban growth, intermittent utilities, affordability pressure, and climate risk mirror pressures now confronting cities worldwide; and how a standards-to-finance pathway turns FM from a cost centre into investable performance (IPCC, 2023; UN DESA, 2025; UN-Habitat, 2022).

1.2. Learning outcomes and practitioner takeaways

- Readers will be able to apply a practitioner framework linking standards, data, finance, and outcomes (SDFO).
- Readers will be able to map a Standards Spine linking ISO 41001, ISO 55000, and ISO 19650 with ISO 14001 and ISO 50001 and market rating schemes (ISO, 2014a, 2018a, 2018b, 2018c, 2026).
- Readers will be able to use a small, portable key performance indicator (KPI) set to keep outcomes visible and financeable, including evidence expectations for lenders and regulators.

1.3. Why Africa, and why now?

Africa concentrates the same forces that are reshaping cities globally: fast urbanisation, intermittent utilities, price sensitivity, climate shocks, and a digitally native, young population (IPCC, 2023; UN DESA, 2025; UN-Habitat, 2022). That combination places FM at the sharp end of daily life: keeping housing safe, learning spaces healthy, and workplaces reliable, while stretching every rand, shilling, naira, or pula. The result is a body of practice that has been stress-tested under constraint.

1.4. Conceptual bridge between African practice and global application

Africa's FM context compresses the same forces now confronting cities elsewhere: rapid growth, intermittent utilities, affordability pressure, and climate risk. Methods refined here – maintainability by design, minimum viable data that matters, outcomes-based payment, and evidence-ready reporting – travel with minimal localisation.

1.5. Why Africa's FM context travels across regions

FM is not a technical afterthought; it is a community lifeline. To understand its urgency and portability, it helps to step back and to look at the forces shaping outcomes: rapid population growth, fast urbanisation, and intergenerational living patterns, which determine how space is used and shared. These pressures are sharp in African cities, but are increasingly familiar in the Asia-Pacific (APAC), Latin America (LATAM) and Middle East and North Africa (MENA) regions and parts of Europe, which is why the same FM playbook travels (UN DESA, 2025; UN-Habitat, 2022).

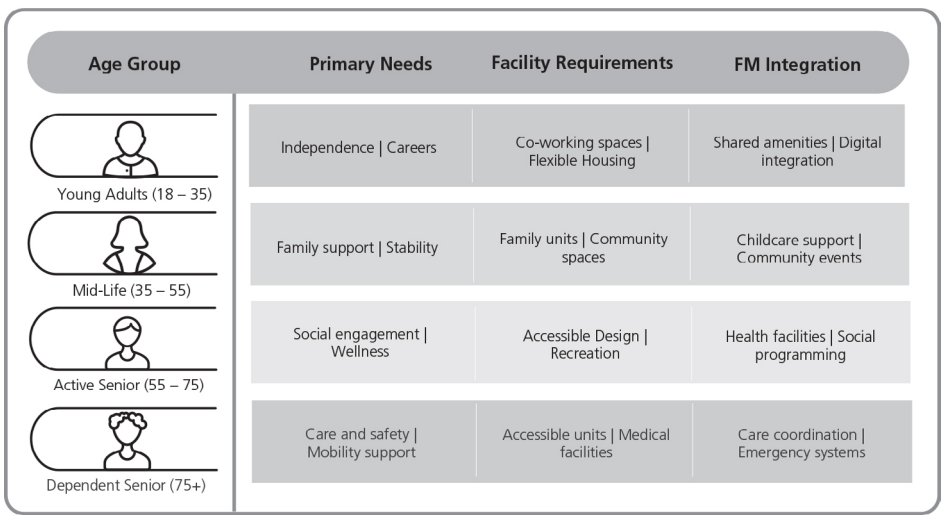
- **Speed**: demand growth and climate stress push assets into failure zones quickly, providing a practical resilience test bed (IPCC, 2023; UN DESA, 2025).
- **Constraints**: intermittent power and water supplies incentivise standardisation and disciplined routines rather than gadgetry (IEA, 2024).
- **Value**: low-capex, high-impact fixes (e.g. controls tuning, leak detection and fabric care) deliver outsized returns when baselines are weak.
- **Proof**: a universal set of indicators for availability, mean time to repair (MTTR), energy intensity (kWh/m^2), water intensity (litres per occupant per day), carbon intensity ($kgCO_2e/m^2$), compliance, first-time fix, and user satisfaction/indoor environmental quality (IEQ) translates into lender-acceptable evidence.

1.6. Demographics and urbanisation pressures shaping FM

1.6.1 Age cohorts and the resulting FM pressures and KPIs

Demographics are a fundamental determinant of the requirements placed on FM, as different age cohorts have different needs and facility requirements (Figure 1.1).

Figure 1.1 Intergenerational Living Framework (Author's synthesis from gerontology, housing and facilities management literature.)



1.6.2 Capital-intensive projects and operating-light budgets reveal the lifecycle financing gap

Many donor and development programmes fund new construction but fail to fund the operations and maintenance (O&M) budgets required to keep facilities viable. This imbalance means that even well-intentioned projects can deteriorate prematurely, not because the concept was wrong, but because the financial architecture did not account for lifecycle management and long-term serviceability (AfDB, 2023; World Bank, 2023). FM bridges this gap by translating handover information into a realistic O&M plan, setting outcome-based service levels, and proving results with simple measurement and verification (M&V) so funders can underwrite performance rather than hope.

1.7. What FM delivers as a portable, outcomes-based function

Seen this way, FM is a guardian of the intergenerational social contract: it manages the conditions under which people live, learn and work, and it proves that those conditions are being delivered consistently (IFMA, 2022; ISO, 2018a). The method used throughout this book is straightforward: start from a clear standard, collect the minimum data that matters, fund what works, and report outcomes in a language that owners, regulators and lenders accept. Africa shows the pattern clearly; the playbook works anywhere.

1.8. Intergenerational living patterns and FM service expectations

Africa's strength has long been its intergenerational household spaces, where care, culture, and responsibility are shared (UN DESA, 2024; UN-Habitat, 2024). Courtyards and shade trees once served as the original 'community hubs', keeping children visible, elders respected and daily life coordinated. Urbanisation has changed the form to towers, gated estates, and busy arterials, but the need has not changed. The FM question is simple: how do we preserve the function of community in modern spaces and make it work under today's constraints?

1.8.1 Translating social patterns into FM requirements

FM translates those social needs into designs, operations, and maintenance that are verifiable and portable across regions.

- **For children**: safe, well-lit play areas and walkable routes to schools; classrooms with reliable water, sanitation, and ventilation; street management that separates traffic from play (KPIs: incident rate ↓, sanitation uptime ↑, IEQ spot checks passed ↑).
- **For youth**: Wi-Fi-enabled study hubs and reliable hot water in residences; affordable, predictable transport linking campus, work, and home; entry-level rental options near opportunities (KPIs: uptime ↑, urgent ≤24 h tickets ↑, kWh/bed ↓, l/bed/day ↓).
- **For families**: resilient homes with predictable utilities and waste services: shared green spaces that reduce conflict and support daily routines; proximity or easy links to clinics, schools, and markets (KPIs: repeat repairs ↓, complaint rate ↓, kWh/m² ↓, compliance ↑).

1.8.2 Active, healthy and age-inclusive environments through FM operations

FM should hard-wire daily movement, social connection and dignity into how places run so that every age group can thrive without stigma. The design brief is universal; the service rules are verifiable (Center for Active Design and New York City Department of Health and Mental Hygiene, 2025; City of New York, 2010).

- **Built-in movement (all ages)**: continuous, step-free walking loops in estates/campuses (≥1.5 m width, benches every 80–100 m); protected cycle/scooter paths with secure parking and charging; stair-first nudges (visibility, lighting, wayfinding) alongside reliable lifts (KPIs: walkable metres delivered ↑, near-miss/incident rate ↓, lift uptime ↑, bicycle parking utilisation ↑).
- **Everyday health**: outdoor gyms, small courts (multi-use), and shaded micro-parks within a 5–10 min walk; drinking water points and clean restroom access on routes; weekly activity programming (guided walks, low-impact classes) (KPIs: facility availability ↑, participation counts ↑, litter/cleanliness audits passed ↑).
- **Food and air quality**: healthy-options policy for cafés/kiosks; vending standards; IEQ checks where people spend time (temperature, humidity, CO2, ventilation, glare, acoustics) (KPIs: IEQ compliance rate ↑, customer satisfaction ↑).
- **Ageism-proof operations**: plain-language signage (≥16 pt) and high-contrast wayfinding; service level agreements (SLAs) that do not assume digital-only access (walk-in desk + phone + online); staff trained in age-friendly customer service and respectful assistance; regular accessibility audits (entrances, toilets, counters, seating heights) (KPIs: accessibility checks passed ↑, complaints re access ↓, service resolution time for walk-ins/phone ↑).
- **Inclusive participation**: co-design sessions with children, youths, caregivers, and elders – publish changes made; intergenerational programmes (e.g. youth digital help desks in community hubs) (KPIs: co-design attendance ↑, 'changes implemented' log maintained, cross-age event counts ↑).
- **20-minute living (transferable)**: essentials within a short walk/ride, such as clinic, pharmacy, groceries, study hub, playground, cash/ATM or digital kiosk (KPIs: % units within 400–800 m of essentials ↑, average travel time to essentials ↓).

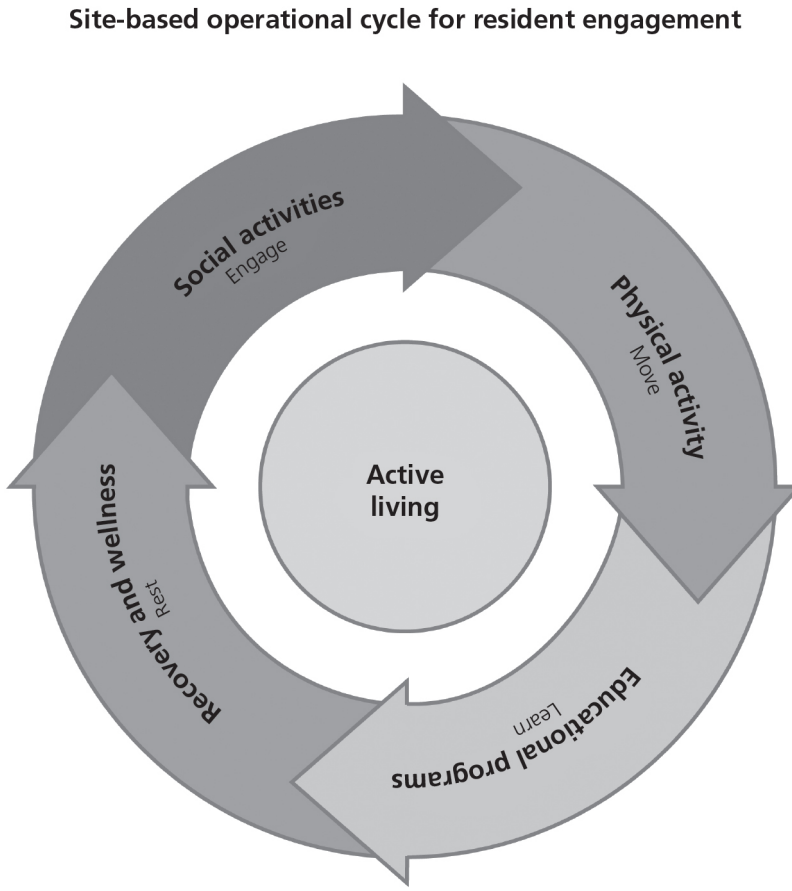
To promote active living, residential estates should have a simple estate map showing step-free routes, benches, shade, cycle paths, water points, restrooms, and wayfinding nodes (Figure 1.2). Movement, dignity and access should be designed into daily life; measured by uptime, safety, and participation.

Inclusive by default: an FM-led framework

Principle 1: Inclusivity is an operational baseline, not a design upgrade

If a space cannot be cleaned, lit, accessed, and navigated by diverse users every day, it is not inclusive, regardless of the design intent.

Figure 1.2 The Active-Living Loop represents a continuous cycle of engagement, movement, learning, and rest, supporting resident wellbeing and facility utilization across the operational environment. *Source*: Author's synthesis from active aging and facilities management literature.



Principle 2: Design must be maintainable or it will exclude

Complex finishes, steep ramps, poorly lit paths, or digital-only services fail first and they fail the most vulnerable users first. FM must therefore review designs for maintainability, inspectability, and service cost realism before approval is given.

Principle 3: One universal checklist, many contexts

Inclusivity is embedded through routine checks, not bespoke solutions.

Minimum FM-led inclusion checks: step-free access continuity (routes, not just entrances); seating and rest points at predictable intervals; lighting levels and glare control; legible wayfinding (contrast, size, symbols); multiple service access modes (digital + physical + phone); toilet access, water points, shaded refuge; response times that do not penalise non-digital users.

Principle 4: Measure inclusion like performance

Tie inclusion to KPIs you already use, not new ones:

- accessibility audit pass rate
- lighting uptime
- incident/near-miss rate
- response times (walk-in vs digital)
- participation counts
- complaints related to access or usability.

1.8.3 Why these requirements travel across cities

These requirements show up in Lusaka and Lisbon, Kigali and Kuala Lumpur. When FM teams hold a small universal KPI set constant – availability, response speed, energy and water intensity, safety/IEQ, compliance – the approach becomes comparable, financeable, and transferable. FM isn't workplace administration; it's the operating system for intergenerational dignity in modern cities (OECD, 2023; World Bank, 2023).

1.9. Facilities management and placemaking function as one delivery system

Placemaking, as covered in this book, is not a design overlay but an operational discipline (le Roux, 2022; RICS, 2022a; UN-Habitat, 2025a). Design sets intent; FM sustains outcomes. Cleanliness, lighting, access, safety, utilities, and programming are not secondary considerations, they are the daily conditions that determine whether a place includes or excludes. Throughout this book, placemaking is therefore treated as a function of FM governance, service levels, and evidence, not aesthetics.

Placemaking creates spaces people want to live, work, play, and learn in; FM keeps those spaces working through policies, service levels, and daily routines. As Pieter le Roux (2022) argues in his presentation on placemaking and FM, the two are inseparable: treating them together produces places that stay safe, clean, reliable, and welcoming, and the method travels beyond Africa with minimal localisation (IFMA, 2022; UN-Habitat, 2025a).

Roots and modern practice: le Roux notes that African placemaking is rooted in communal courtyards, market squares and shade trees – the continent's original 'facilities', collectively maintained for safety and belonging (le Roux, 2022, 2024). Modern districts can keep that DNA if FM is specified from planning through operations: clear ownership of public-realm tasks, lighting and path upkeep, waste rules, water points and vendor management. Tradition becomes a service plan.

1.9.1 Translating placemaking intent into measurable service outcomes

FM converts a diagram into a lived environment by defining service outcomes and routines that can be measured and audited (ISO, 2018a).

- **Housing**: lit routes, managed refuse, working utilities, responsive repairs, and neighbour rules that reduce conflict.
- **Commercial**: uptime targets, IEQ checks, first-time fixes, and predictable operating costs.

1.9.2 Operational matrix linking placemaking elements to FM tasks and KPIs

Table 1.1 and Figure 1.3 turn placemaking into FM work by showing who maintains what, to which standard, and how results are measured. The next subsections skip repetition of the matrix and focus on why each row matters in practice and how FM teams can use the tasks and KPIs to keep places safe, connected, and investable over time.

The Placemaking Accountability Matrix (Figure 1.3) translates common placemaking elements into practical FM tasks and a small KPI set that can be applied consistently across contexts.

The matrix demonstrates that placemaking is not abstract: it becomes operational when FM defines who maintains what, to which standard, and with what evidence. Safety becomes lighting uptime and incident rates. Connectivity becomes network availability and response times. Green infrastructure becomes canopy coverage and surface temperature reduction. Each element is measurable, auditable, and transferable (IFMA, 2022; RICS, 2022a).

The matrix also provides the operational framework referenced throughout Section 1.9. It anchors the placemaking discussion in FM-specific tasks and universal KPIs, showing readers exactly how 'design intent' becomes 'daily accountability'. Without it, the section would remain conceptual; with it, the method becomes replicable.

Figure 1.3 Placemaking Accountability Matrix – roles, responsibilities and FM accountability (Author's synthesis from stakeholder management and placemaking literature.)

Roles, responsibilities, and FM accountability

Responsibility	FM Contribution	Success matrix
Strategic direction budget allocation	Governance alignment resource planning	Policy adherence budget compliance
Participation feedback	Accessibility event facilitation	Engagement rate satisfaction score
Daily operations maintenance	Service delivery incident response	Uptime% response time
Specialised services vendor management	Coordination quality assurance	Service level compliance

Table 1.1 Placemaking Accountability Matrix

Placemaking element	FM Tasks	KPIs
Safety and accessibility	Lighting audits and replacement cycles; CCTV and sightline checks; step-free access (ramps, lifts), tactile paving); clear after-hours protocols	Lighting uptime (%); incident/near-miss rate; accessibility audit pass rate (%); response time to hazards (hrs)
Everyday connectivity	Uptime SLAs for Wi-Fi in hubs; wayfinding and real-time information boards; first/last-mile links (drop-off bays, cycles, shuttles)	Network uptime (%); helpdesk first-time fix (%); average travel time to essentials (mins); cycle/parking utilisation (%)
Mixed uses that shorten journeys	Coordinated opening hours, security and cleaning rotas across housing/retail/health/education; waste and delivery management plans	Complaints per 1000 users; shared-area cleanliness score; delivery conflicts; tenant retention (%)
Cultural anchors and place identity	Maintenance of public art/heritage assets; programming calendar (markets, performances); vendor rules and stall allocation	Programme attendance; asset condition score; vendor compliance rate (%); user satisfaction score
Green and blue infrastructure	Tree canopy care; irrigation/leak checks; shade structures; micro-park upkeep; stormwater/bioretention maintenance	Canopy coverage (%); surface temperature reduction (°C); irrigation leaks resolved (hrs); park availability (%); litter audits passed (%)
Health and active living (age-inclusive)	Step-free walking loops; benches every 80–100 m; protected cycle paths; outdoor gyms/small courts; drinking water and restroom points	Loop continuity delivered (m); participation counts; fall/incident rate; IEQ checks in hubs (pass %)
Governance and funding backbone	Publish service levels; Quarterly Evidence Packs (KPIs and M&V); community reporting channel (walk-in/phone/online); small works budget with rapid approval	SLA compliance (%); resolution time (hrs/days); community feedback closed-loop rate (%); minor-works delivery time (days)
