

The background image shows a bright, modern industrial facility. In the foreground on the left, a silver scissor lift is partially visible, with a white bag on its platform. The lift has '1003ea' printed on its side. In the background, there is a wooden desk with a black top, a white chair, and various industrial equipment. The ceiling features a complex network of orange structural beams and white pipes. The overall atmosphere is clean and professional.

About the Authors

Dr N. Muthukumar is President and COO of Meritor India, driving business development, growth and future strategy with 33 years of rich experience in the Automobile and Pharmaceutical sector. In his previous assignment, he was President at Automotive Axles limited and instrumental in the capacity enhancement and transformation of AAL Manufacturing into Industry 4.0. He started his career with TVS Srichakra Tyres in 1987 and was heading Operations for Sundaram Industries Limited. Later, he was running International Business of TTK before joining Meritor. He was driving force in making all the Indian operations of TTK-LIG, TPM certified by JIPM. He is a resource faculty for JIPM TPM for CII and past chairman CII Karnataka.

Dr K. Ganesh is Senior Knowledge Expert, Global Lead of 'Manufacturing and Supply Chain Center of Competence' (MSC CoC) & Delivery Leader at McKinsey & Company, Chennai, India. He is specialized in logistics and supply chain transformation for various industry verticals. He is having total 16+ years of research and consulting experience. He has published more than 150 papers in leading international journals and written 11 international books. He is editorial board for 5 international journals and in reviewer board for 10 + renowned international journals.

Dr Sanjay Mohapatra has received his B.E. from NIT Rourkela, MBA from XIMB, M.Tech from IIT Madras, India, and PhD from Utkal University. Dr Mohapatra consulted many organizations in different domains such as utilities, banking, insurance and healthcare sectors. His teaching interests are in IT Strategy and Management Information Systems and research interests are in the area of IT-enabled processes. He has authored/co-authored 28 books, more than 78 papers in national and international referred journals besides publications in different conferences.

Dr K. Tamizhjothi is Associate Professor in Business Administration, Annamalai University, with 23 years of teaching and industrial experience. He has written 5 books, published 112 articles and presented 57 papers in national/international conferences. He has guided 7 PhD and 5 MPhil scholars. He has received 'Best Researcher Award' from IIMK and also received 'Respected Teacher Award' and 'Best Paper Award'. He has successfully completed four consultancy research projects. He is an editorial board member and reviewer of various journals. His

area of specialization is Marketing Research, Operations Research, and Logistics and Supply Chain Management.

Dr R.M. Nachiappan is Associate Professor, Department of Manufacturing Engineering, Annamalai University, and currently deputed to Government College of Engineering, Thanjavur. He has 19 years of teaching and 4 years of industrial experience at world renowned manufacturing organization like TVS, TTK. He has administrative experience of 4 years as NSS programme officer, Deputy Controller of Examination in Annamalai University. He has written 2 books and published 43 articles at the national and international levels. His area of specialization is World Class Manufacturing, Lean, Six Sigma, Total Productive Maintenance, Performance Evaluation and System Design, Operations Management.

Dr M. Bharati is Associate Professor at Veer Surendra Sai University of Technology, Odisha. She is the member, standing committee of Nodal Centre for Research, Research Council of University and Member of Board of Studies of different Government Universities and Institutes. Along with extensive teaching and research experience, Dr Bharati has consulting experience for environmental planning projects. She has worked for international collaboration project on Urban Conservation. She has publications in peer-reviewed international journals and has authored books and chapters for international publishers. Her research interests are in the areas of environmental planning and management and environmental behaviour.

Chapter 1

Introduction

1.1 Impact of Globalization

Consequent to globalization, in recent times, manufacturing companies have been passing through a critical phase of high competition. Under these circumstances of stiff competition, the consumer is the ultimate decision-maker for any product based on their dependability, availability and overall value that the consumer perceives. Hence, in order to win the customer's favour, it is imperative that each company is compelled to meet and beat the best ones from anywhere in the world. Traditionally, product pricing was based on the manufacturing costs and the profits were fixed by stakeholders commonly known as cost-based pricing. However, during post globalization, customers, being interested in continuous price reduction, fix the price on the basis of maturity of the product cycle, that is, introduction, growth, maturity or decline. Customers decide the price reduction in the scale of 5, 4, 3, 2 and 1. That is, at the end of the first year, they want 5% reduction from its initial price; at the end of the second year they want 4% reduction, and so on. In this manner, customers fix the product price and the stakeholders fix the profit either keeping constant or in increasing trend. As shown in [Expression 1.1](#) (Anantharaman & Nachiappan, 2006; Ravichandran, 2005), cost is the only parameter to be controlled and managed by the managers of the organization to decide upon the price of the product – 'Price-based costing'.

Once design is frozen and a product is industrialized, usually major cost sits on manufacturing activities as input material and conversion cost alone account for 80–85% of a product cost. Serious cost reduction is necessary to reduce the price and to remain competitive in the global market, and this can be accomplished by taking measures to improve the manufacturing system of the product (Farsijani & Carruthers, 1996). Therefore, it is now increasingly necessary for engineers and managers to give more attention to improving the process of manufacturing in order to remain relevant. Furthermore, in contemporary highly challenging environment, an economic production system has been identified as a crucial factor for competitiveness (Pintelon, Pinjala, & Vereecke, 2006).

2 Organizational Culture and Its Impact on CI

Expression 1.1 Cost Equation.

Cost-based Pricing:

| | | | | |
|--------------------|---|------------------------------|---|---|
| Cost | + | Profit | = | Price |
| Manufacturing cost | | Profit fixed by stakeholders | | Market is price taker. Market has no influence on price |

Price-based Costing:

| | | | | |
|--|---|---|---|---|
| Price | - | Profit | = | Cost |
| Global market expects decreasing price | | Stakeholders require increasing returns | | Continuous pressure to reduce by effectiveness in manufacturing |

1.2 Manufacturing

Manufacturing operation is one of the prime strategic functions of any business (Yamashina, 2000). It is an economic term that refers to making goods and offering services to satisfy human wants (Black, 2002). It implies value created by applying useful mental or physical labour. It is a process of adding value to the raw materials and resources, and therefore, it should be considered as the heart of economy in an organization. It is an essential process of creation with a purpose (Sinha, 1997).

The original meaning of ‘manufacture’ is to make things by hand. However, at present, the meaning has quite widened. ‘Manufacturing’ is the conversion of a design into a finished product. Production has a narrower sense, namely, the physical act of making the product. Manufacturing has a history extending several thousands of years and comprises the following three important features:

- *Providing basic means of human existence:* Without manufacturing or production of goods, a human being cannot live, and this is increasingly so in modern society.
- *Creating wealth of nations:* Manufacturing creates the wealth of a country or a nation.
- *Promoting human happiness and world peace:* An affluent and prosperous country can provide security, welfare and happiness to its people. Such a country no longer needs to invade other countries or to wage war and consequently, manufacture of weapons will stop, and it will result in world peace.

The overall manufacturing and its process flow has been illustrated in [Fig. 1.1](#). Inputs like material and energy go through manufacturing process and get transformed into finished products for customers.

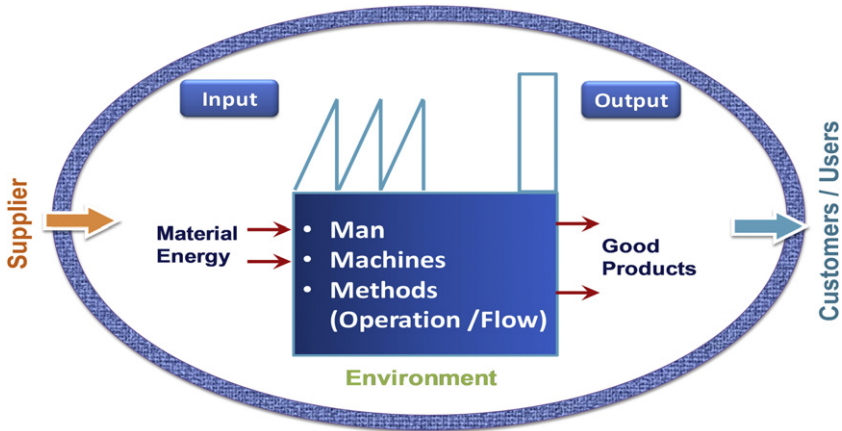

Fig. 1.1. Manufacturing and Its Components.

If the products or services of a manufacturing system have to reach customers, it has to be flexible enough to comply with changes tailored to meet the customers' demands and desires (taste). The arrangement and operation of machines, tools, materials, people and information to produce a value-added physical entity or service is characterized by a measurable parameter called performance measure (Cochran & Dobbs, 2002). Depending on the maturity of manufacturing systems in an organization, manufacturing excellence can be ranked at various levels. World class manufacturing (WCM) level is considered as the highest level of manufacturing excellence. The following section explains more about WCM.

1.3 World Class Manufacturing

In the era of globalization with major players from all over the world, the term world class is appropriate. WCM is a term widely recognized in manufacturing, encompassing a wide range of activities. WCM implies that it has the ability to compete in globally competitive market. It is considered the best system in the world in terms of production and operation capability. The term WCM implies the pursuance of best practices in manufacturing (Miller, 1991).

Schonberger (1986) has described WCM as analogous to the Olympic Games motto – *citius, altius* and *fortius* (faster, higher and stronger). It is described as a collective term for a number of production processes and organizational strategies, which have flexibility as their primary concern (Haynes, 1999). Gunn (1987) strongly emphasizes on the role of technology in WCM, and Hall (1983) stresses that WCM is a fundamentally different way of operating an organization. Giffi, Roth, and Seal (1990) view quality and customer as the primary focus of WCM, supported by a combination of manufacturing strategies and capabilities, organizational facts and human assets. Hayes and Wheelwright (1985) emphasize that

4 Organizational Culture and Its Impact on CI

it is necessary to have the capability to be a superior competitor to define world-class manufacturing. Fujio Cho, chief engineer of Toyota Corporation, states as follows: ‘Waste is anything other than the minimum amount of man, machine, material, parts and space which are absolutely essential to add value to a product’. Womack, Jones, and Roos (1990) have stated that WCM uses less of everything – ‘half the human effort, manufacturing space, tools and money’. Also, it requires less than half the inventory on site, leads to a few defects and produces a greater and ever-growing variety of products.

1.3.1 Objectives of WCM

WCM rediscovers the vital role played by zero in manufacturing management. When the manufacturing companies march towards perfection (the zero stage), a whole new range of exciting possibilities are thrown open like zero break down in maintenance, zero defects in process, zero accident and so on (Fig. 1.2). The zero target demands a radical change in the mind-set of people about the operational life (Beck, 1989).

Experience suggests that the means adopted to achieve these ends are vital as the ends themselves. In the pursuit of zero approach, Japanese firms have graduated from Parts per Million (PPM) defects scale to Parts per Billion (PPB). It can be achieved by the implementation of CI tools in manufacturing.

1.4 Continuous Improvement

Continuous improvement (CI) is defined as a systematic effort to seek out and apply new ways of doing work by actively and repeatedly making process improvements. Process is nothing but sequences of tasks aimed at creating value-adding transformations of inputs – material and information – to achieve intended outputs (Upton, 1996). CI involves establishing customer requirements (internal or external), meeting the requirements, measuring success and continuing to check customers’ requirements’ requirements to find areas in which improvements

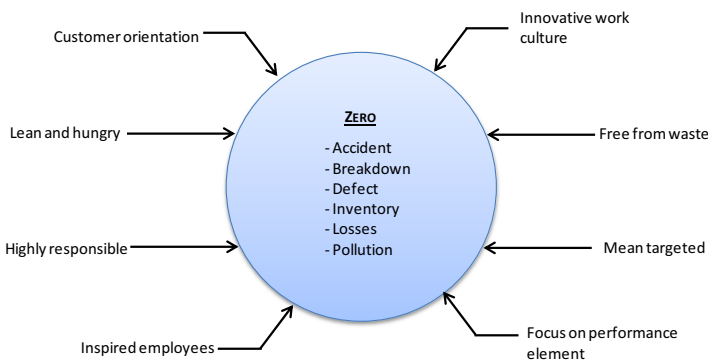

Fig. 1.2. Goals of WCM.

can be made (Chang, 2005). CI is an ongoing activity aimed at raising the level of organization-wide performance through focused incremental changes in processes (Bessant & Caffyn, 1997; Wu & Chen, 2006). CI initiative implies bundles of practices, such as prescribed sequences of steps for carrying out projects and sets of tools and techniques commonly used to execute these projects (Handel & Gittleman, 2004; Pil & MacDuffie, 1996). Furthermore, several studies also identify the importance of CI, as a part of quality management practices, in the sense of its contribution to the organizational/manufacturing performance (Cua, McKone, & Schroeder, 2001; Douglas & Judge, 2001; Kaynak, 2003; Sila, 2007; Terziovski & Samson, 1999).

Companies aim to achieve continuous improvement capability through the deployment of continuous improvement tools such as lean management and Six Sigma (Voss, 2005). The underlying foundations are seen to be a culture for innovation, focusing on critical processes and the involvement of employees, together with the integration of improvement activities throughout the organization.

1.5 WCM Awards and Winning Criteria

From the growth of technology and shifting customer expectations to the emergence of new markets and global competition, it is clear that what it takes to be successful today is different from what it took just a decade ago – and certainly different from what it was when the US Congress passed the Malcolm Baldrige National Quality Improvement Act in 1987. The purpose of the Act and the awards program it spawned was to enhance US competitiveness by encouraging companies to focus on Quality and Manufacturing Performance Excellence. It did this by establishing criteria for evaluating improvement efforts, identifying and recognizing role-model companies and disseminating and sharing best practices (CI tools being adopted in that organization).

After all, global companies can source from anywhere in the world. Transparency makes it harder for companies to hide mistakes. The era of information-driven globalization is characterized by frequent, rapid and sometimes unpredictable change, both done by leaders and done to them by events in the external world. Globalization increases the speed of change, as more competitors from more places produce surprises. Currently, with respect to manufacturing companies, the GEM council awards are of the highest repute worldwide, and the world leaders in their respective fields such as Cannon (copier), Bridge stone (tyre) and Toyota (automotive) have received the GEM council awards.

1.5.1 Global Excellence Model (GEM) Council

1.5.1.1 . About the Organization

The GEM Council members are administrators of business excellence programmes from the United States, Europe, Japan, Australia, India, South America and Singapore. The Council meets regularly to share knowledge and experiences, explore opportunities for collaboration and review the criteria to keep them current and relevant. The details about worldwide (across 75 countries) award

6 *Organizational Culture and Its Impact on CI*

administrating companies and the corresponding names of awards are listed in [Table 1.1](#) (given as in alphabetical order of the country in the world). The Manufacturing Excellence Award may recognize recipients who demonstrate excellence against the award guidelines and evaluation criteria.

1.5.1.2 Awards Assessment Process

The process begins when an organization submits an award application. The application and supporting documents are reviewed for completeness and a site visit is scheduled and business excellence assessors appointed. The assessors will evaluate the award application and after that site visit is conducted to assess the organization based on the manufacturing excellence worldwide standards. The site visit generally lasts from 1.5 to 2 days. After the site visit, the assessors review the findings, verify the company's achievement report, write the feedback report and make recommendations on the outcome of the assessment. Recipients of the Manufacturing Excellence Award are selected based on the combined results of the achievement report review and site visit feedback. The governing council (CEOs of world leading organizations and business experts) approves the award recipients. All applicants will receive a feedback report highlighting their strengths and areas of improvements in manufacturing. Based on the country, the award is given in various names but the assessment procedure is of the same kind.

1.5.1.3 Assessment Criteria

The assessment for award is made on the basis of nine parameters, namely, productivity, cost, quality achievement, morale (employee empowerment), safety, environment, flexibility and delivery (time). The primary focus of the award is to acknowledge CI being adopted for transformation process and for creativity. This award supports vision, mission and values of inspiring commitment to enterprise excellence through shared learning and access to best practices. The goal is lead to eliminate all non-value-added processes, which requires attention to the three M's: waste (MUDA), unevenness, fluctuation, and variation (MURA), and overburdening people or equipment (MURI). The three M's should be viewed as fitting together as a whole system. It is important that the achievement report outline the role and relationship of all three M's. Examples of an organization's accomplishments and results can be presented to document improvement (such as setup time reduction, lead time reduction, NVA elimination and saving nature).

1.5.1.4 Timeline for the Award

The timeline is the sequence of activities to be carried out for getting the award and is presented in [Table 1.2](#).

In India CII and EXIM bank joined together in 1994 (refer [Table 1.1](#)) for administrating the GEM procedure for awarding Indian manufacturing companies for promoting excellence among them. The award has been named as 'CII-EXIM' award for business excellence.

Table 1.1. Worldwide Manufacturing/Business Excellence Awards.

| No | Country | Name of the Award | Administrative Companies |
|----|-------------------|--|---|
| 01 | Argentina | National Quality Award of Argentina (Premio Nacional a la Calidad) | Foundation for the National Quality Award (FNQA) |
| 02 | Aruba | Aruba Quality Award | Aruba Quality Foundation |
| 03 | Australia | Australian Business Excellence Award | SAI Global |
| 04 | Austria | Austrian Quality Award | Austrian Foundation for Quality Management (AFQM) |
| 05 | Belgium | K2 Award | Flemish Centre for Quality Management (VCK) |
| 06 | Brazil | Brazil National Quality Award | Brazilian Foundation for the National Quality Award |
| 07 | Brunei Darussalam | Brunei Civil Service Excellence Award | Brunei Darussalam's Civil Service |
| 08 | Canada | Canada Awards for Excellence | National Quality Institute of Canada |
| 09 | Chile | National Quality Award of Chile (Premio Nacional a la Calidad) | National Center of Productivity and Quality |
| 10 | China | China Quality Award | China Association for Quality |
| 11 | Colombia | Colombia National Quality Prize | National Government of Columbia |
| 12 | Costa Rica | Costa Rica Excellence Award | Costa Rican Chamber of Companies |
| 13 | Cuba | National Quality Award of Cuban Republic | Ministry of Economy and Planning |
| 14 | Cyprus | ECO-Q Recognitions | ECO-Q Magazine |
| 15 | Czech Republic | Quality Award of the Czech Republic | Czech Quality Award Association (CQAA) |
| 16 | Denmark | Danish Quality Prize (Danske Kvalitetspris) | Center for Ledelse |
| 17 | Egypt | The National Award for Excellence in Quality | Industrial Modernization Centre (IMC) |
| 18 | Estonia | Estonian Quality Award | Estonian Centre for Excellence (ECE) |
